

# Permeable Pavement: A New Chapter

Annette Lucas, PE  
(919) 807-6381

[annette.lucas@ncdenr.gov](mailto:annette.lucas@ncdenr.gov)

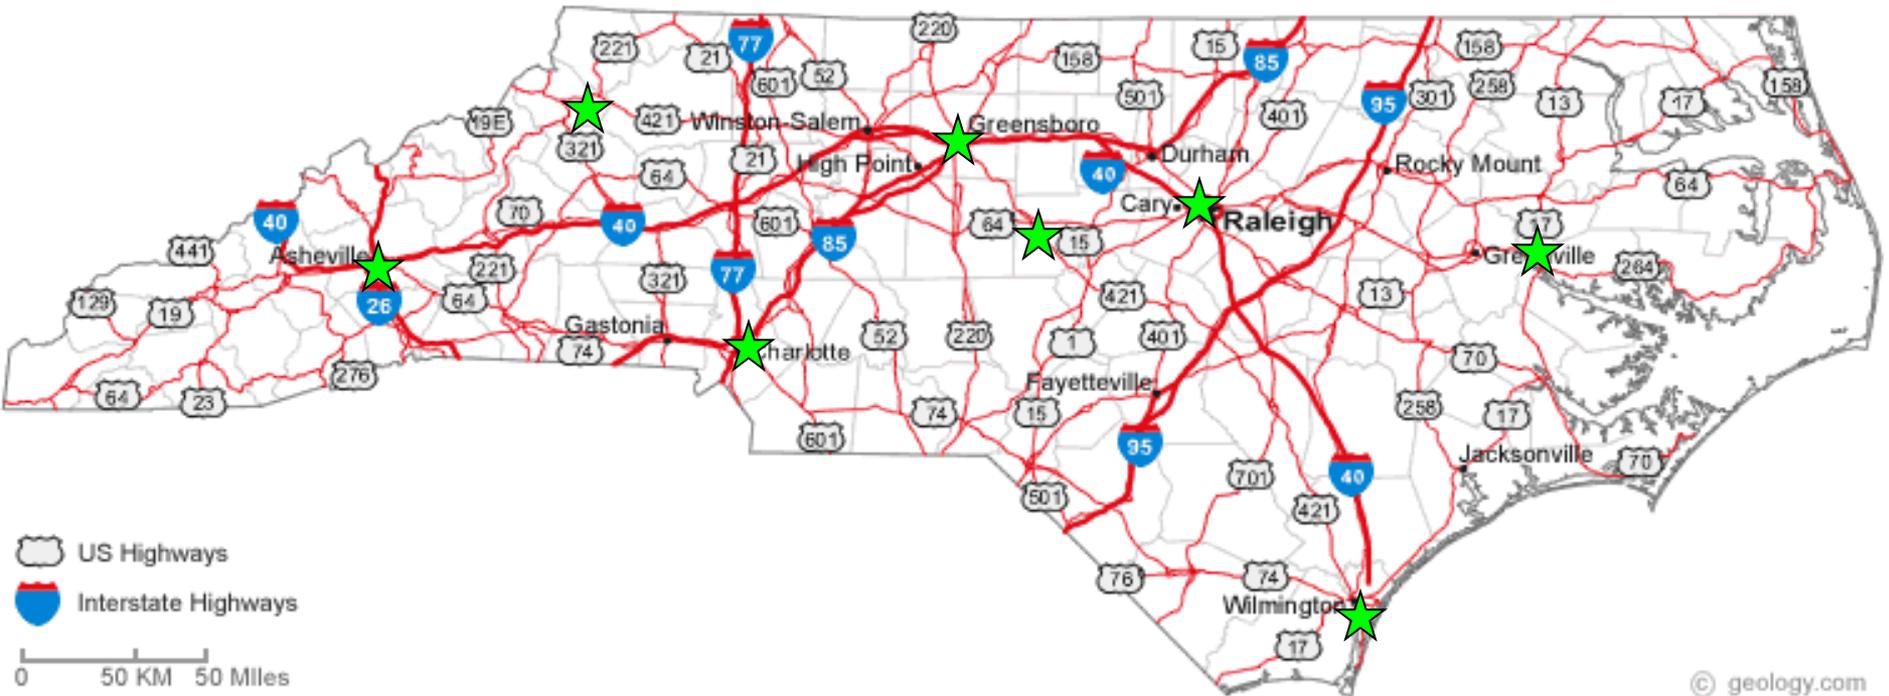

NC Division of Water Quality  
Wetlands & Stormwater Branch

Began the revision in January  
Public noticed on June 1  
Final version Oct. 16

# Permeable Pavement: 2012 Tour

This talk will cover:

**WHY** are we revising the chapter?

**HOW** are we revising the chapter?

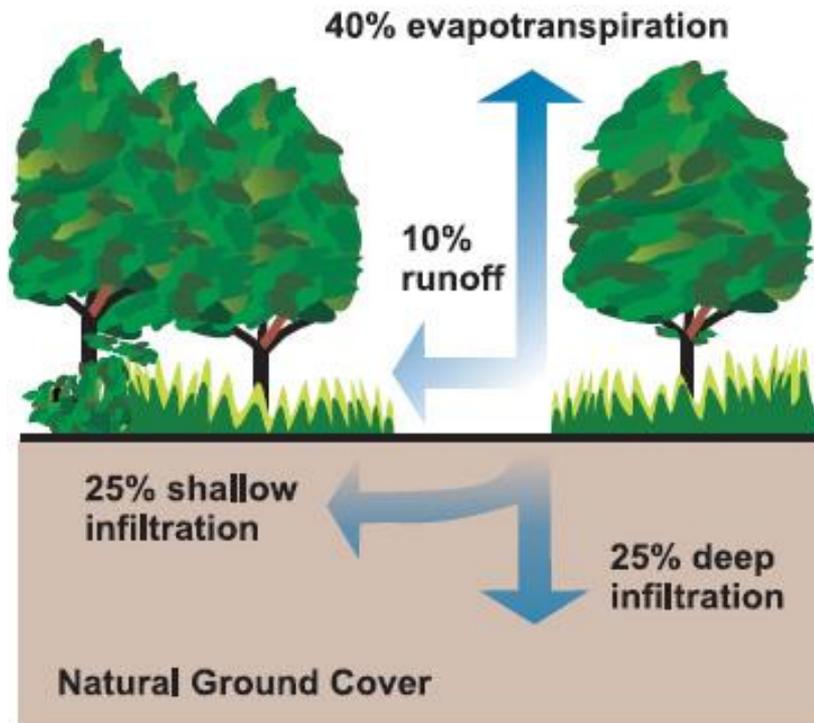

# **WHY** are we revising the Permeable Pavement Chapter?

- Current stormwater practices ARE NOT working
- Permeable Pavement IS working state-wide
- Other benefits for the site besides water quality

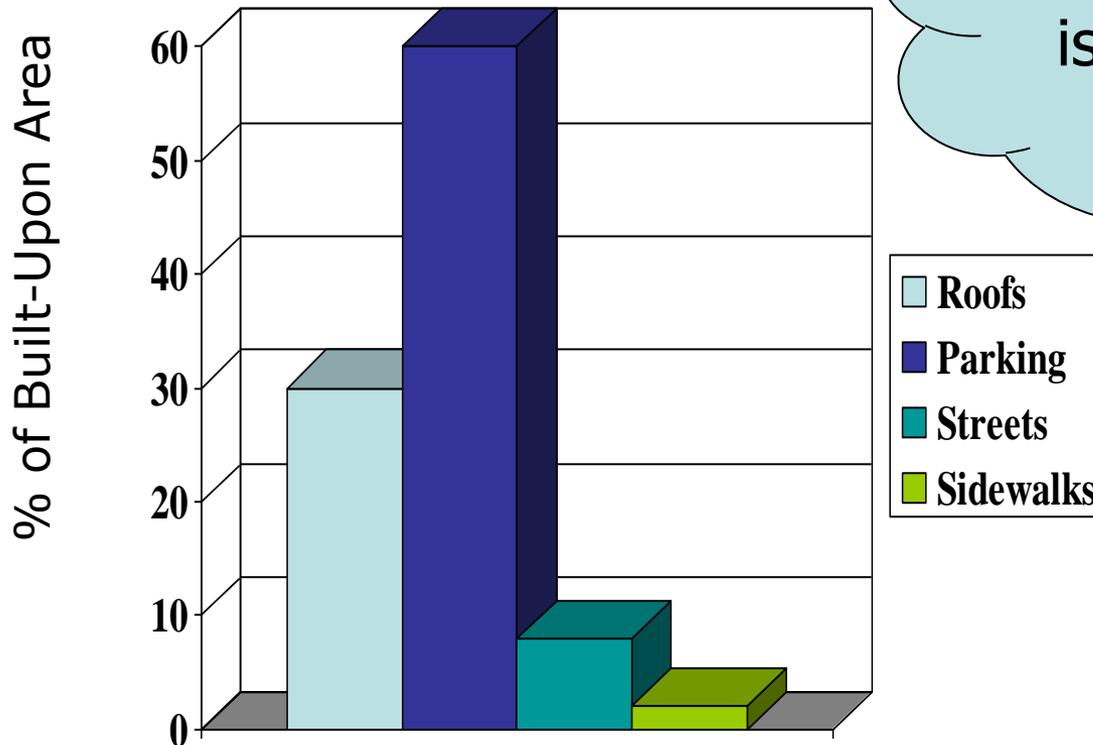

# Hydrology 101

# Land Use Planning 101

Commercial

About 70% of built-upon area on a commercial site is parking, streets and sidewalks.

# Most common stormwater BMP

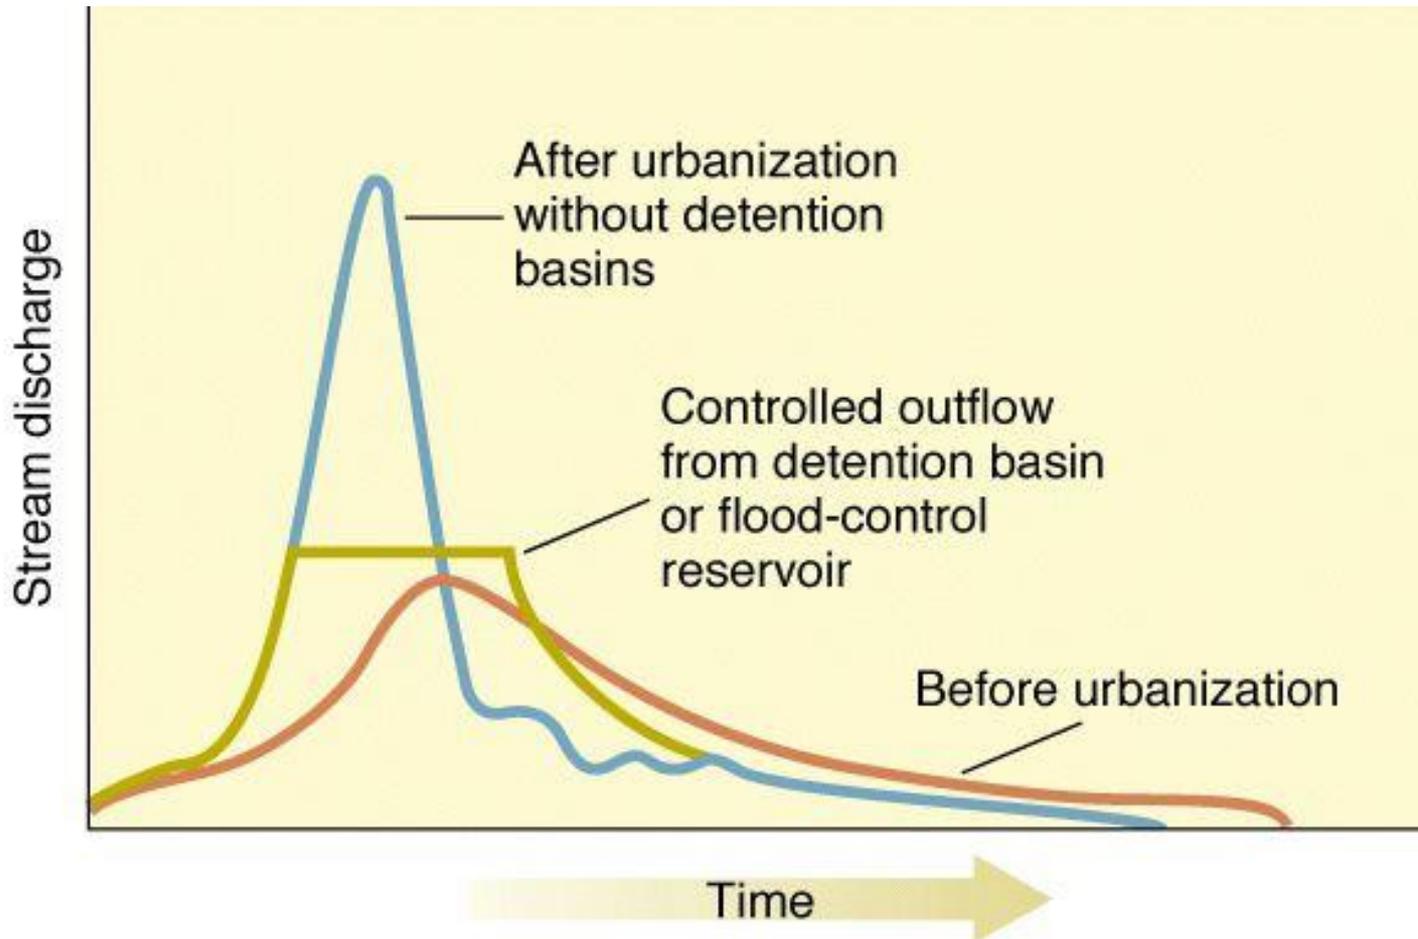

Stormwater in

Stormwater out

# Here's the Hydrograph!

Higher high flows

Lower low flows

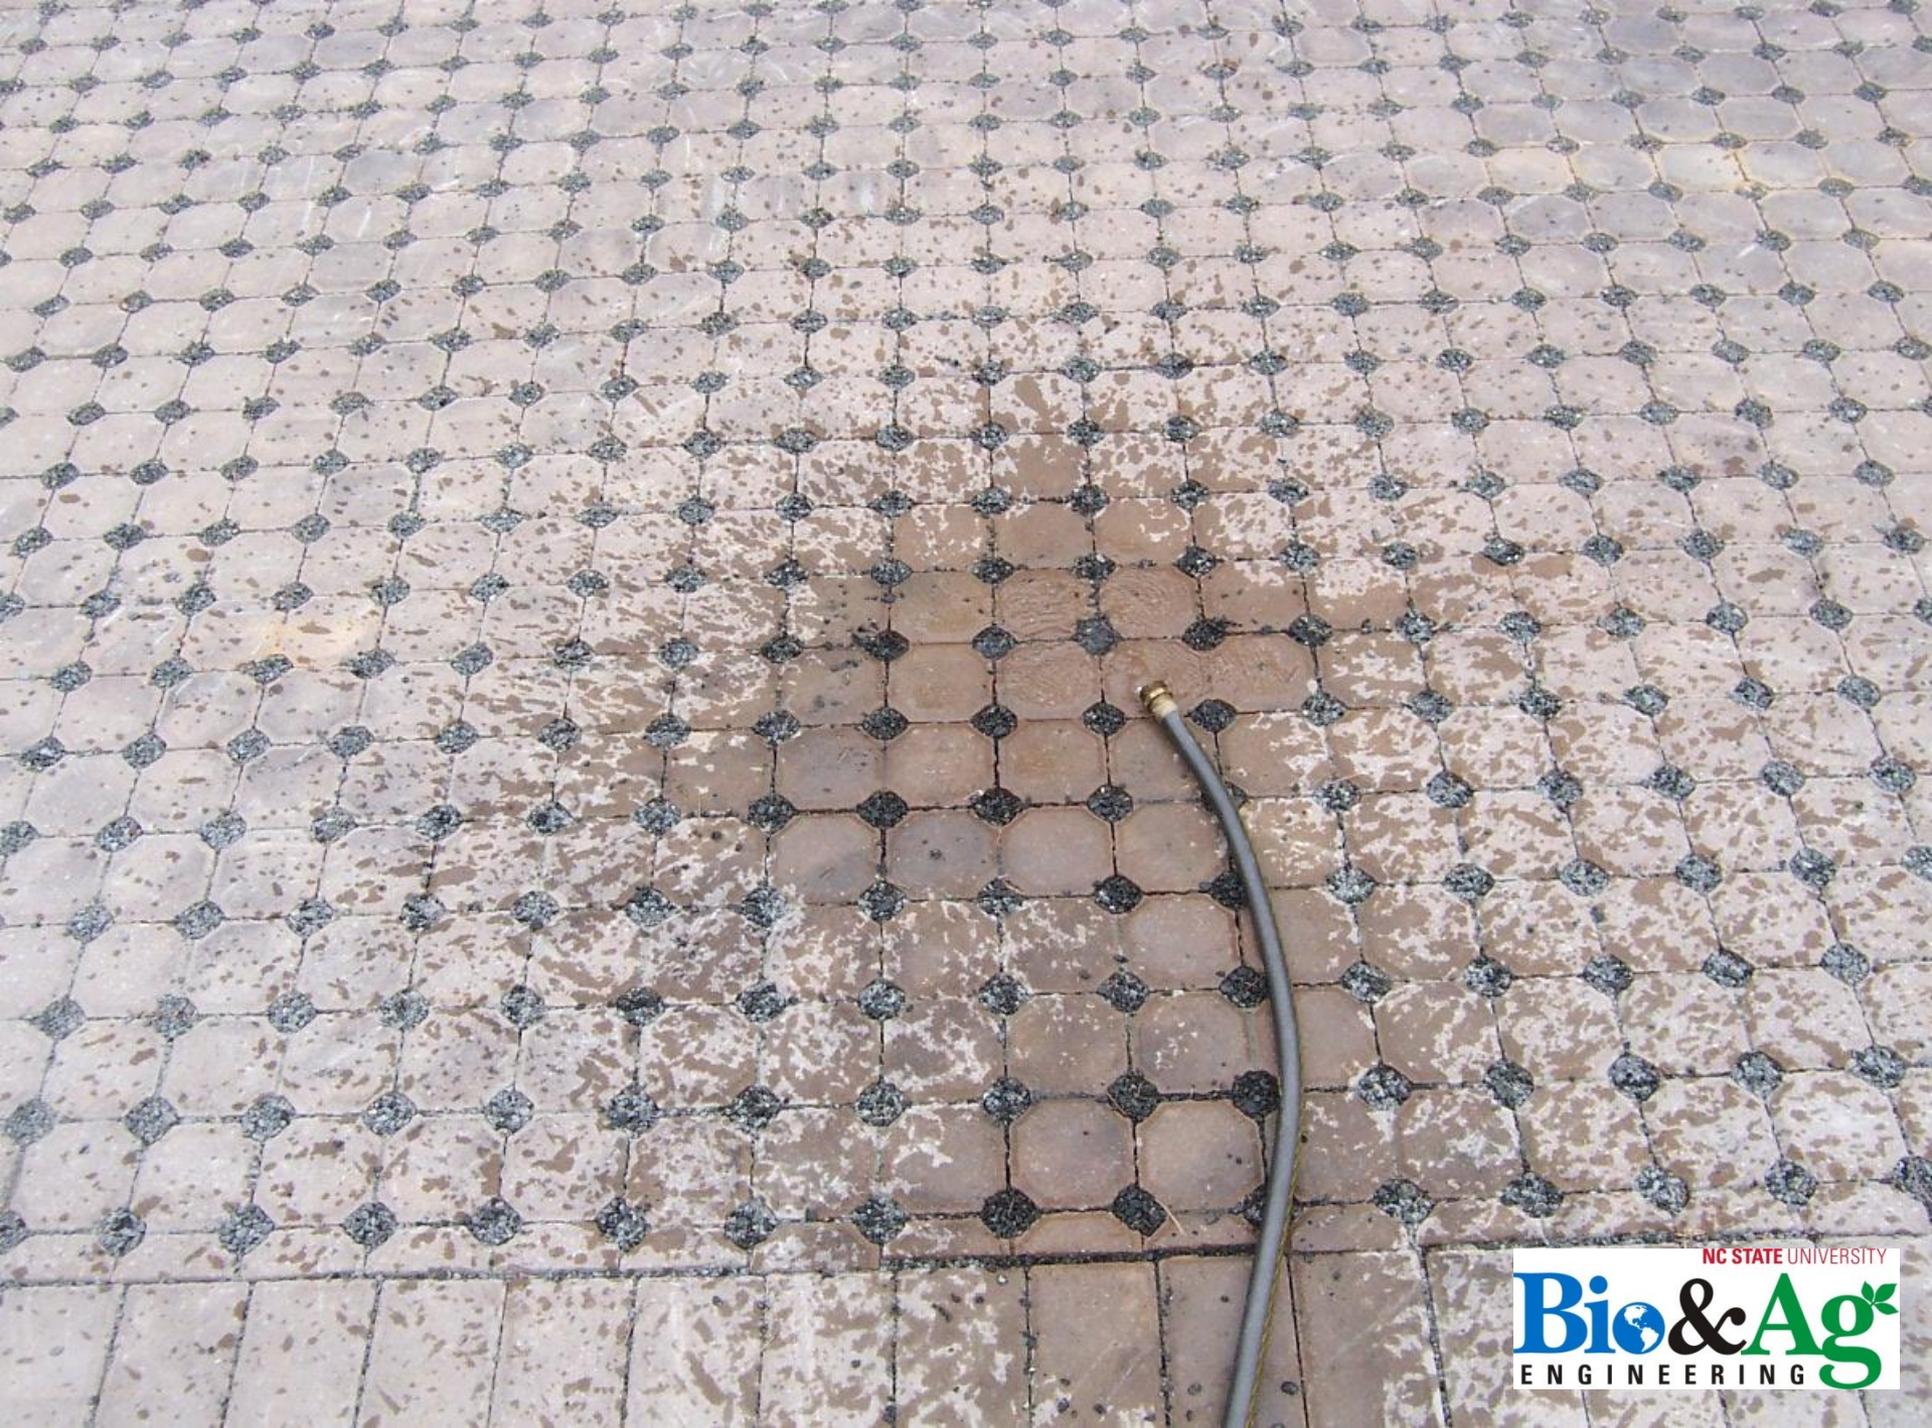

Urban stormwater is the #1 cause of stream degradation.

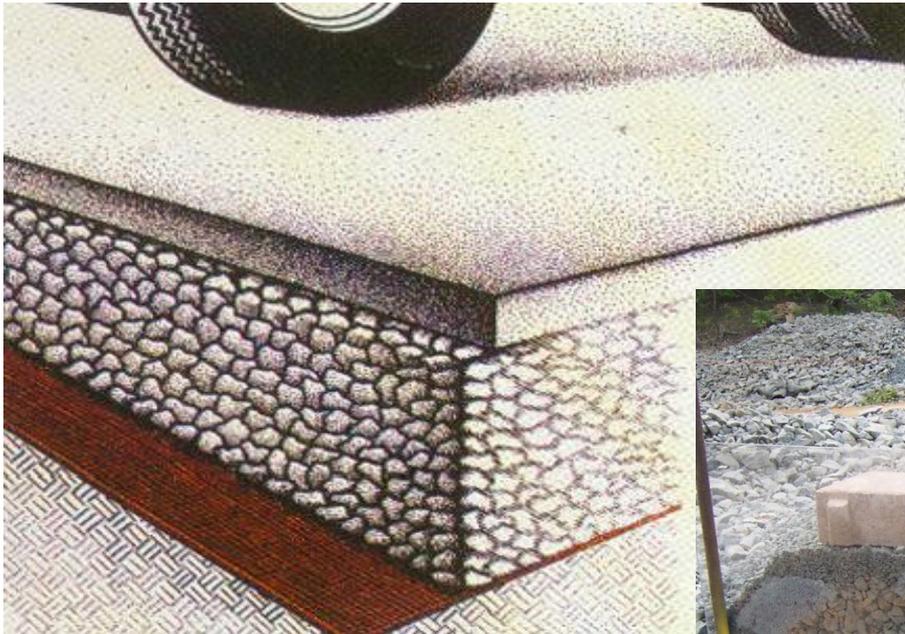

Leaf packs, sticks, large woody debris

**WHAT** if  
we went to  
the source  
of the  
problem?

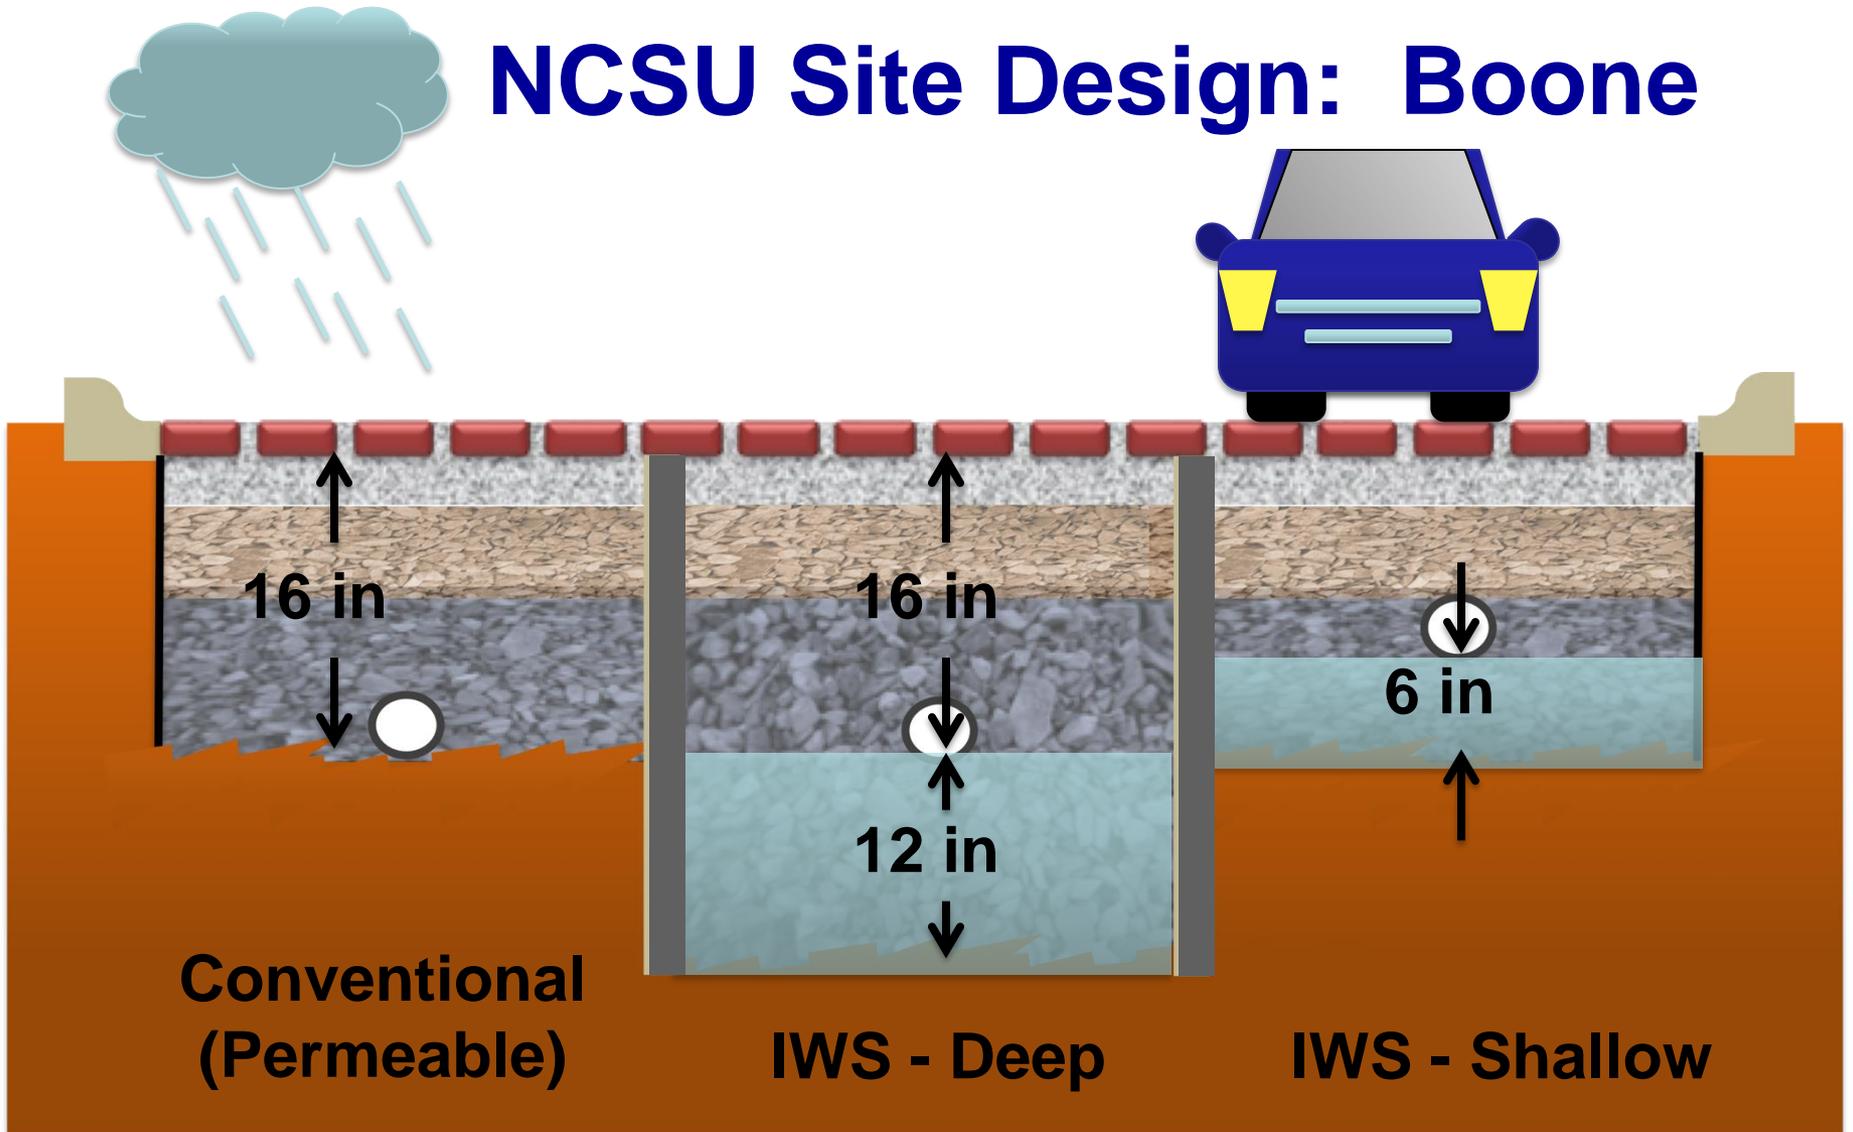

Stores **STORMWATER** in an aggregate layer to enable infiltration. If water cannot infiltrate, then it can be detained & released.

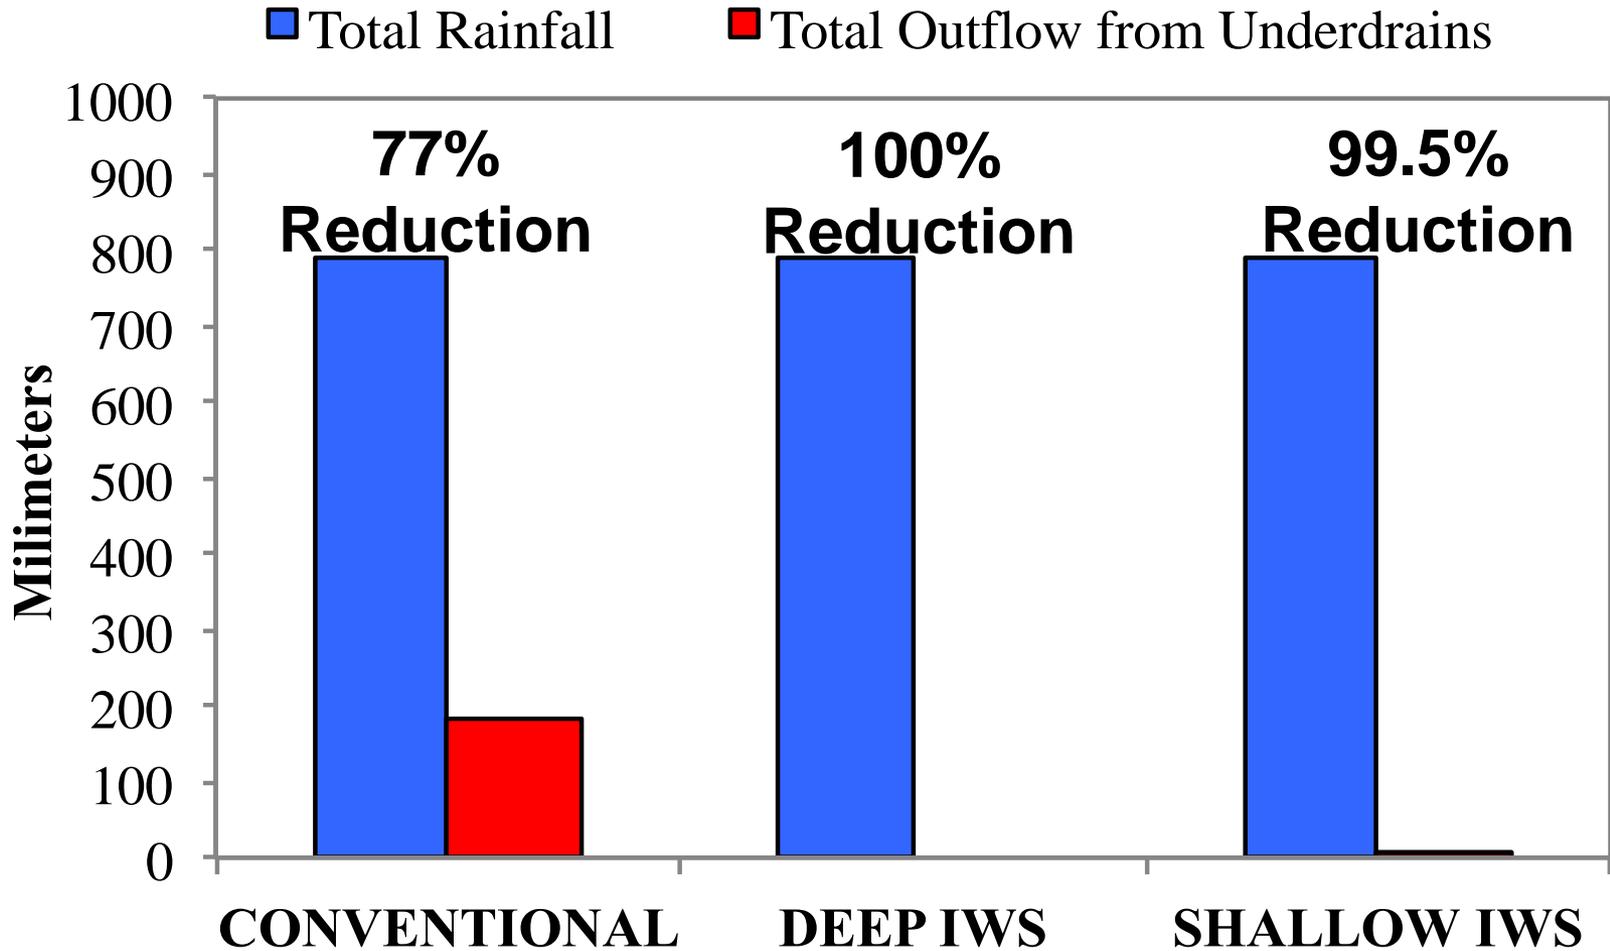

# NCSU Site Design: Boone

NC STATE UNIVERSITY

**Bio&Ag**  
ENGINEERING

# Results of Boone Study

NC STATE UNIVERSITY

Other Benefits besides water quality!

Dry streets  
Dry shoes  
Safety

Permeable Pavement costs more per sq ft than conventional pavement, but it allows developers to avoid other costs.

Protecting streams is also an economic issue!

# How did DWQ Decide on the New Design?

- **Research by NCSU & others**
- **Advice from local experts** (Ready Mixed Concrete Assoc, Fred Adams Paving Co, UNC-CH, Estes Design Group)
- **Design standards from other states** (OH, MD, DE, PA)
- **Data gathered during our field trip**

# New Permeable Pavement Chapter: DWQ Goal

Provide design standards that will insure both short and long term excellent performance of permeable pavement for both water quality and structural goals.

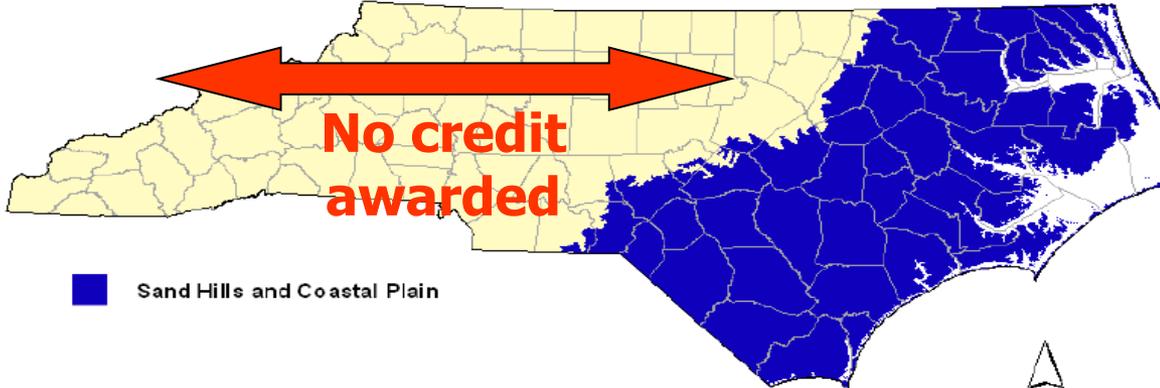

A photograph showing a paved area with a red brick-patterned permeable pavement strip running alongside a road and a body of water. The strip is made of interlocking bricks with a textured surface. To the left is a grey asphalt road, and to the right is a concrete curb and a sandy area. In the background, there is a body of water, trees, and a building under a blue sky with clouds.

**HOW** are we revising  
the Permeable Pavement Chapter?

# #1: Statewide Use and Credit

**Before:**

**Credit awarded** ↓

**No credit awarded**

■ Sand Hills and Coastal Plain

0 100 200 Miles

+ 0.52 in/hr soil infiltration

**After:** Credit awarded state-wide but design allowances must be made for differing soil permeabilities.

## Approximate Soil Infiltration Rates (Ferguson 2006)

<b>Texture</b>	<b>Infiltration Rate (inch/hour)</b>
<b>Sand</b>	<b>8.27</b>
<b>Loamy sand</b>	<b>2.41</b>
<b>Sandy loam</b>	<b>1.02</b>
<b>Loam</b>	<b>0.52</b>
Silt loam	0.27
Sandy clay loam	0.17
Clay loam	0.09
Silty clay loam	0.06
Sandy clay	0.05
Silty clay	0.04
Clay	0.02

Note: 0.52 in/hr = 13 in/day, more than one quarter of the annual rainfall expected in Raleigh (45 in) or Charlotte (44 in).

### **Why?**

Research has shown that these limitations are not necessary.

## #2: More Credit Awarded

**Before:** Permeable pavement received a BUA credit as 60% or 40% pervious depending on the type of pavement and the depth of the aggregate.

### Why?

This is a more accurate way to estimate the effectiveness of permeable pavement.

**After:** Permeable pavement will receive BUA credit based on the soils, not the location of the pavement.

Credit  $\neq$

or

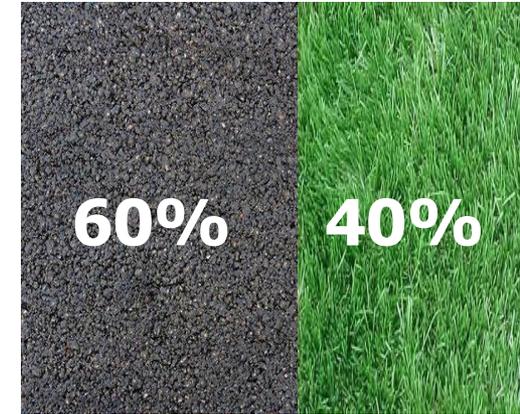

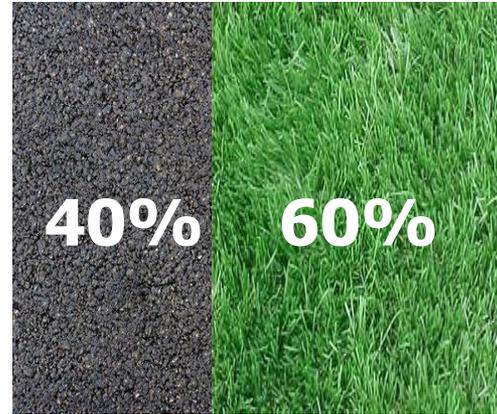

The BUA credit is used to determine whether the site is high or low density. After that the BUA credit does not affect the design of the site or the pavement.

# BEFORE:

Permeable pavement

Coastal Plain  
→

Rest of state  
→

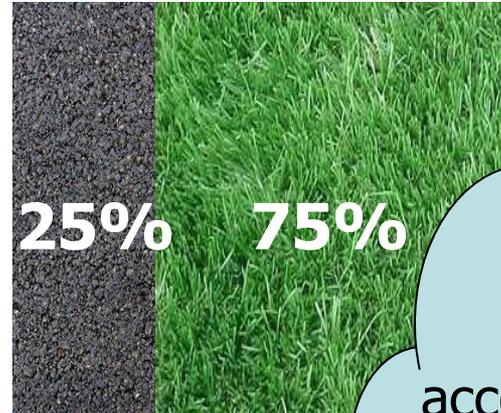

No credit

# AFTER:

Permeable pavement

A & B  
soils  
→

C & D  
soils  
→

**Why?**  
These numbers account for permeable pavement's performance while also accounting for potential maintenance issues.

## How BUA Credit Can Affect a Site

Need this size lot to be low density for Phase 2.

Building

Conventional Asphalt

Low density for Phase 2  
– C and D soils.

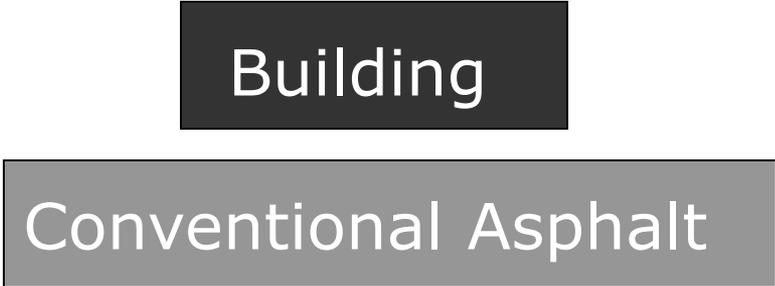

Building

Permeable Pavement

No piped conveyances.

## How BUA Credit Can Affect a Site

Need this size lot to be low density for Phase 2.

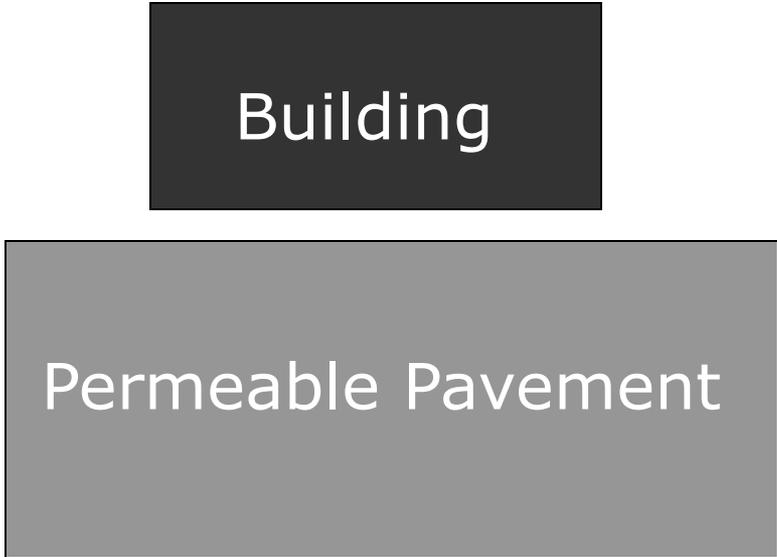

Building

This diagram shows a site layout with a dark grey rectangular box labeled 'Building' positioned above a wider, lighter grey rectangular box labeled 'Conventional Asphalt'.

Conventional Asphalt

Low density for Phase 2  
– A and B soils.

Building

This diagram shows a site layout with a dark grey rectangular box labeled 'Building' positioned above a wider, lighter grey rectangular box labeled 'Permeable Pavement'.

Permeable Pavement

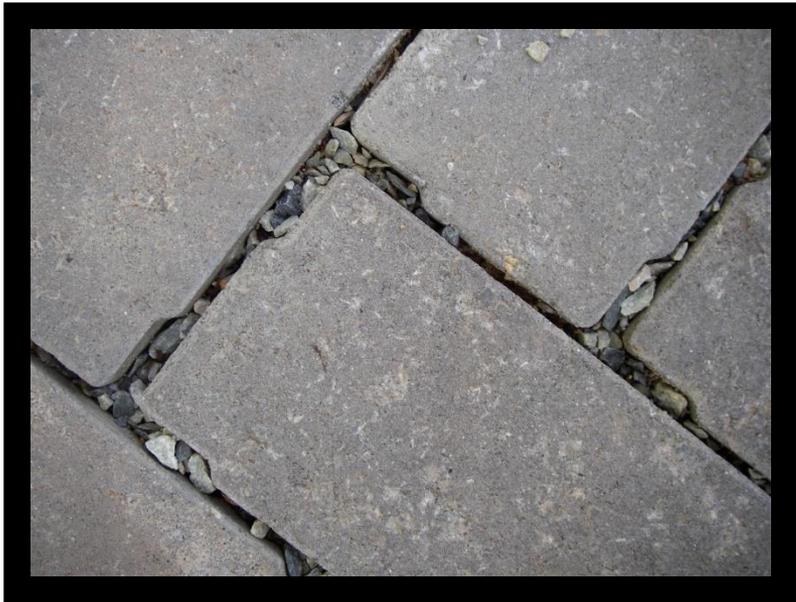

No piped conveyances.

## #2: More Credit Awarded, Continued

**Before:** Permeable pavement did not receive credit for removing pollutants.

**After:** Significant pollutant removal credit is awarded to permeable pavement based on the design of the system.

# Pollutant Removal Credits

## Infiltrating systems:

- 85% TSS
- 30% Total Nitrogen
- 35% Total Phosphorus

### **Why?**

The research data supports pollutant removal credit.

## Detention systems (explained in a minute):

- 70% TSS with an impermeable liner
- 85% TSS with no liner
- 10% Total Nitrogen
- 10% Total Phosphorus

# Permeable Pavement is Joining a New Club

## 85% TSS Removal:

Wet detention pond  
Stormwater wetland  
Bioretention cell  
Sand Filter  
Infiltration basin/trench  
Permeable pavement \*

## <85% TSS Removal:

Dry detention pond  
Grassed swale  
Vegetated filter strip

## BUA Credit Only:

Permeable pavement

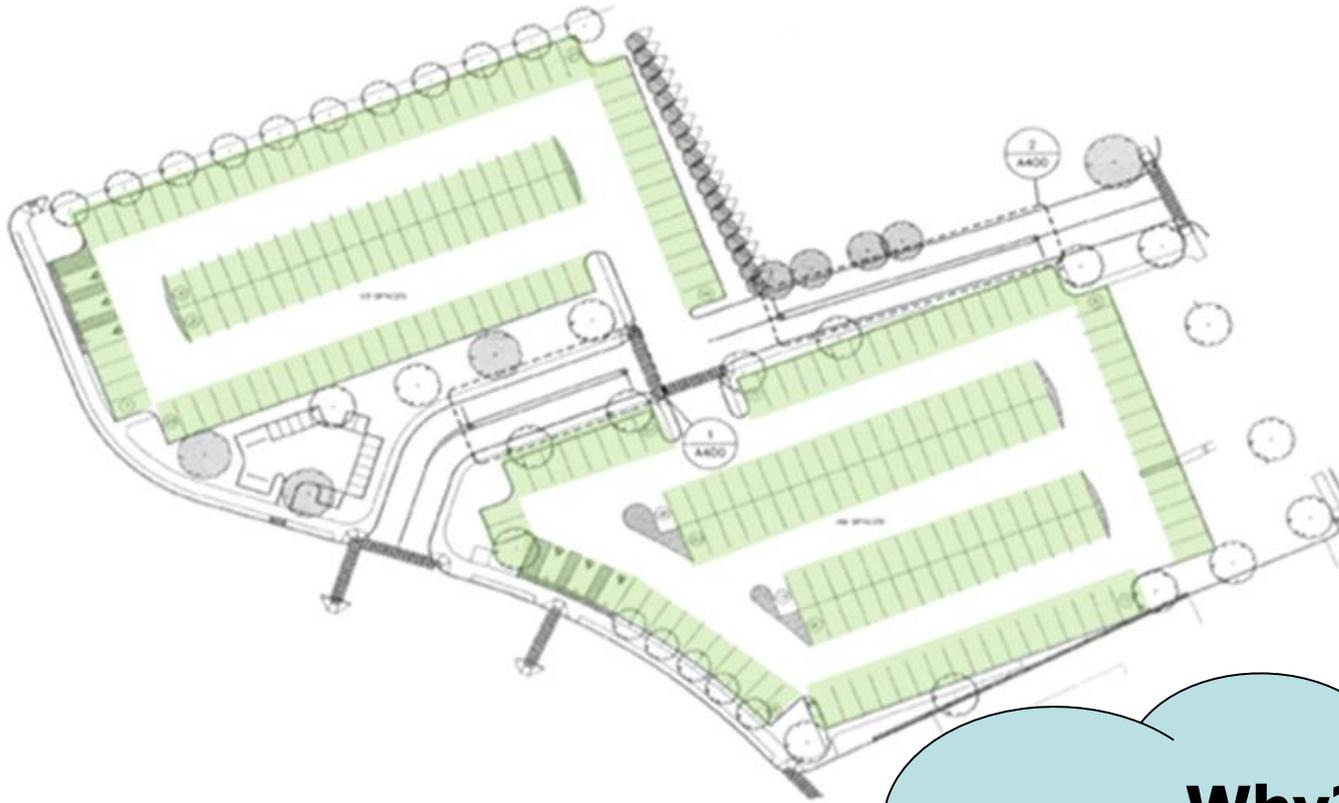

\* This is the only device in the 85% club that also gets BUA credit.

## #3: Adjacent BUA can be Treated by Permeable Pavement

**Before:** Permeable pavement may not have any adjacent areas on the site discharging to it.

**After:** Runoff from site BUA can be directed to the pavement to receive pollutant removal credit.

## **Why?**

This has worked in other states and if designed correctly, can work in NC too.

## #4: Requiring Soil Testing

**Before:** A high soil infiltration rate was assumed and there was a “cookie cutter” design.

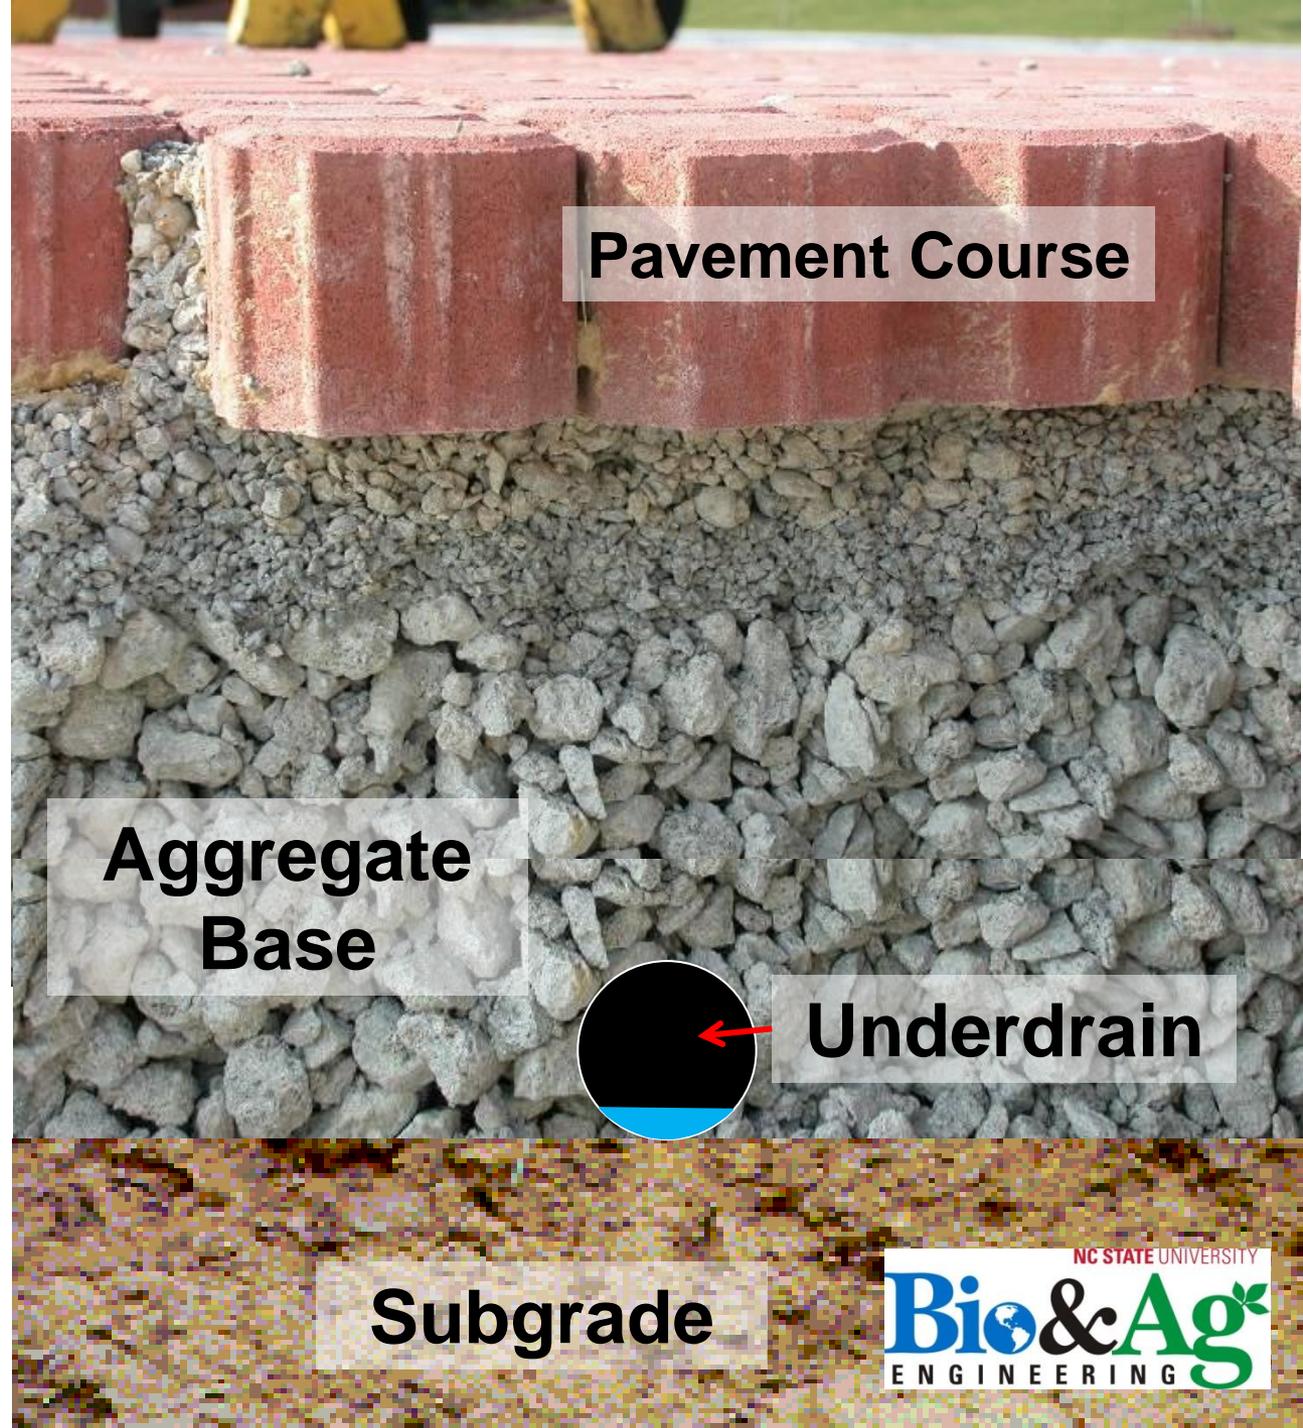

**After:** Soil testing must be done and used as the basis for the pavement design.

### Why?

The design of the permeable pavement must be customized to the soils, particularly when used in areas with lower permeability.

# Standard permeable pavement cross section

Pavement Course

Aggregate Base

Underdrain

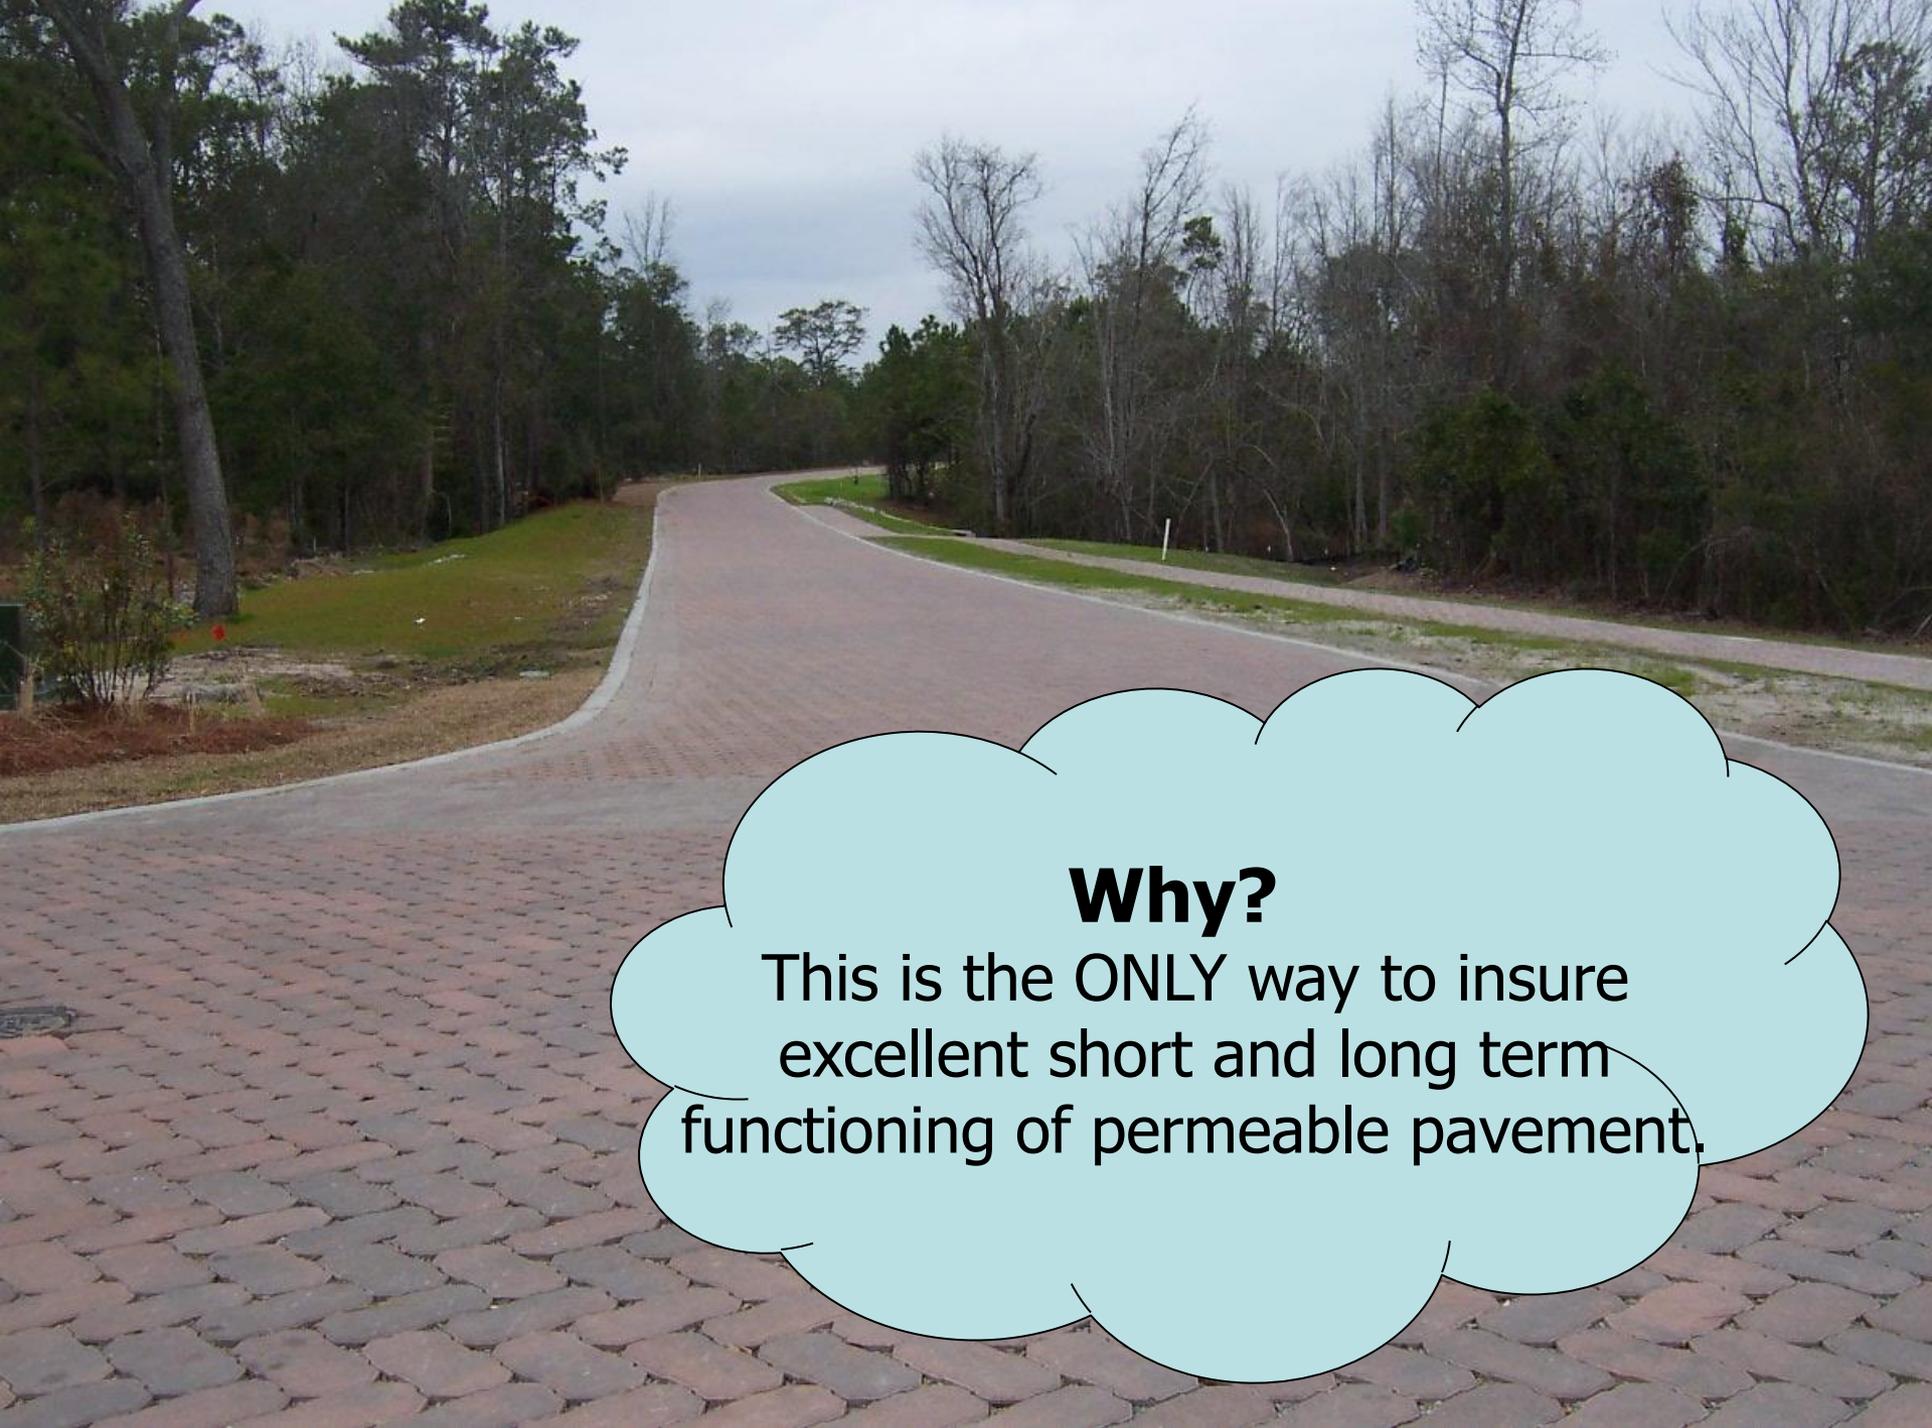

Subgrade

## #5: Higher Bar for Construction & Maintenance

**Before:** Very little mention of construction techniques. Maintenance requirements were not comprehensive.

**After:** Clear, comprehensive construction and maintenance requirements.

A photograph of a paved road with a light blue cloud-shaped text box overlaid on it. The road is made of reddish-brown pavers and curves to the right. The background shows a line of trees under a cloudy sky.

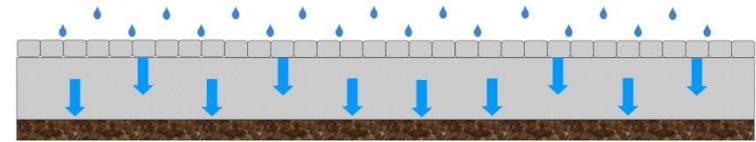

## **Why?**

This is the ONLY way to insure excellent short and long term functioning of permeable pavement.

**Before:** No signs required.

**After:** Signs are required to inform users and managers about the care of permeable pavement.

## PERMEABLE PAVEMENT

**ACTIVITIES PROHIBITED:**  
**SANDING**  
**RE-SEALING**  
**RE-SURFACING**  
**POWER WASHING**  
**STORAGE OF MULCH OR SOIL**  
**STORAGE OF SNOW PILES**  
**STORAGE OF HEAVY LOADS**

## Why?

Lots of effort and \$ can be wasted with one uninformed action on permeable pavement.
